Аннотация

This paper describes a recursive approach to the enumeration of some classes of combinatorial tasks. Most tasks are used in the specific scope of teaching and learning informatics through olympiads and other competitions. Combinatorial problems can often lead to interesting and beautiful dynamic programming tasks, because they both depend on recurrence relations: formulae that solve a larger problem in terms of one or more smaller problems.

Keywords: programming contests, informatics olympiads, combinatorial tasks.

Abstract

This paper describes a recursive approach to the enumeration of some classes of combinatorial tasks. Most tasks are used in the specific scope of teaching and learning informatics through olympiads and other competitions. Combinatorial problems can often lead to interesting and beautiful dynamic programming tasks, because they both depend on recurrence relations: formulae that solve a larger problem in terms of one or more smaller problems.

Keywords: programming contests, informatics olympiads, combinatorial tasks.
